on ethno veterinary formulation for mastitis.

CMT

Mastect

For detection of mastitis, refer Literature for details

CMT/Mastect helpful in
detection of “Sub-clinical
mastitis” which occurs
before any visible changes
are seen in the milk or
udder.

- Sub-clinical mastitis can be controlled by providing the animal 10 grams of trisodium citrate in drinking water consecutively for 10 days. If left untreated, sub-clinical mastitis causes a reduction in milk production and may further lead to clinical form of mastitis.
- Ethno veterinary formulation (EVM) of “*Aloe vera*, Turmeric and Lime mixture” can be used to control clinical mastitis and thus reduce the use of antibiotics.

Healthy udder, Quality milk, Wealthy farmer
